

New Diagnodent Diagnostic Laser!!

NO more poking teeth to see if you have a cavity!! Dr. Stevens has used the **Diagnodent Diagnostic Laser** cavity detection system since 2000!!

Decay can actually be spread from tooth with a dental explorer (poker instrument). The **Diagnodent** works similar to the police radar gun. A laser light beam is sent out to the tooth. A hard tooth will reflect it quickly; a soft tooth will absorb it giving a digital readout of how soft the tooth is!! We have **NEVER** seen the **Diagnodent** misread a cavity!!

Dr. Stevens has also used digital x-ray equipment since 1996... which uses up to **90% less** radiation than film equipment!

Later this summer, we will introduce ultrasound into our practice. The dental s-ray will be the new x-ray... **NO RADIATION!!!**
