

FOR IMMEDIATE RELEASE:

I am pleased to announce that our community now has access to the newest FDA-cleared, chronic wound therapy on the market, **Vaporous Hyperoxia Therapy (VHT)**.

VHT is available on a limited basis and not yet accessible to large healthcare systems.

Please consider referring your wound care patients for state-of-the-art wound care in my practice. Working together as a referral team, we can achieve the universal goal of healing chronic wounds to best meet the needs of our patients.

VHT is a Low-Frequency, Non-Contact, Non-Thermal, Ultrasonic Mist therapy that has been clinically validated as a safe and effective treatment for 9 different types of skin wounds including diabetic foot ulcers, venous leg ulcers and post-surgical wounds.

*weighted average of 3 clinical studies.

VHT consistently triples healing on chronic wounds in 20-weeks or less. VHT is a safe and effective adjunct therapy deemed appropriate for wounds that have failed standard of care for 30+ days.

Thank you for considering a collaborative interdisciplinary team approach that would benefit our chronic wound community.
